

Built from real conversations. Not a boardroom.

We spent years working inside healthcare organisations before we built a single line of code. What we kept seeing convinced us something had to change.

THE PROBLEM

Workforce planning deserves better than spreadsheets or guesswork.

Healthcare teams are among the most dedicated in any industry. Practice Managers juggle shifting demand with limited visibility. Nurses adapt constantly to gaps no one saw coming. Owners carry the weight of running a sustainable business while delivering quality care.

Despite enormous advances in clinical technology, workforce planning has been left behind, still held together by spreadsheets, whiteboards, and reactive decision-making. Not because people aren't capable. Because nobody built the right tools.

Practice managers

Absorbing constant roster changes without the data to stay ahead of them.

Nursing teams

Stretched during peak periods while capacity sits idle elsewhere.

Reception staff

Fielding pressure from every direction without operational visibility.

Practice owners

Making major workforce decisions without the data to support them.

WHY WE BUILT THIS

We kept asking the same question.

We've worked alongside healthcare organisations across Australia for years. We've sat with practice owners, managers, and clinical teams and the same pattern kept emerging.

Why is workforce planning still so reactive? Why are managers forced to guess?

Organisations were making some of their biggest operational decisions without reliable data. Talented teams were working incredibly hard with no visibility into what was coming. That's where Medari began — not from a funding round or a whiteboard session, but from those conversations.

WHAT WE BELIEVE

Better operations create better outcomes for everyone.

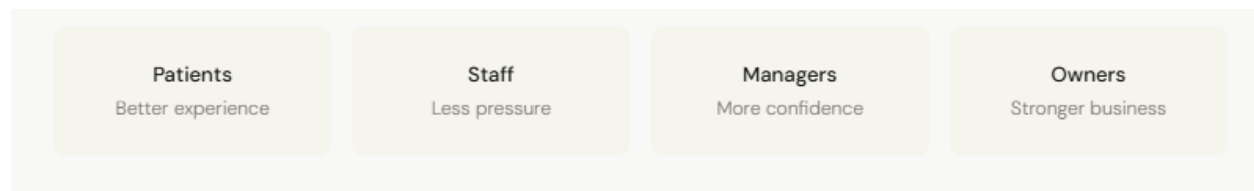

Healthcare organisations should be able to see demand before it arrives, not scramble after it does.

Managers should spend less time fighting operational fires and more time leading their teams.

Workforce planning should be proactive. The data already exists, it just needs to be surfaced.

Technology should reduce operational stress, not layer more complexity on top of it.

When healthcare teams are supported properly, everyone benefits.

HOW WE WORK

Built with healthcare, not just for it.

Medari is being developed alongside the organisations that use it. We listen to what's working, fix what isn't, and build what's actually needed — not what looks good in a demo.

This isn't about software. It's about helping the right people be in the right place at the right time, every day. When you get that right, everything else follows.

If you believe healthcare teams deserve better tools, we'd love to hear from you.

We're early, we're deliberate, and we're building alongside organisations who share this belief. Whether you're a practice manager, owner, or someone who's felt this problem firsthand — get in touch.
